# MODEL 1000HP-1+8

## DIFFERENTIAL PRESSURE REDUCING REGULATORS

MODEL 1000HP-1+6

### OVERVIEW

Models 1000HP-1+6 or 1000HP-1+8 are differential reducing regulators used to maintain a relatively constant pressure differential between the fluid loading pressure –  $P_{Load}$ , and the valve’s outlet pressure -  $P_2$ , with  $P_2$  pressure higher than  $P_{Load}$  pressure.

Model 1000HP-1+6 is a single-diaphragm differential construction. Model 1000HP-1+8 is a double-diaphragm differential construction. A double-diaphragm design prevents the fluid passing through the body from mixing into the loading fluid pressurizing the spring chamber in the event of a diaphragm failure.

The design takes advantage of all the features of the basic 1000HP reducing regulator; see Technical Bulletin 1000HP-BASIC-TB. The availability of optional construction and body and trim materials is limited to those indicated in this Technical Bulletin.

### APPLICATIONS

Widely applied in steam atomization systems using heavy oil (Nos. 3 - 6, Bunker C) to fuel burners. Also used to maintain constant differential pressure across the multiple port flow rate control valve frequently supplied to control fuel flow to a burner.

A differential reducing regulator may also be applied for pressure loading service, allowing remote setpoint variation or sequential pressure control for batching operations. A “special” case of pressure loading is when a differential reducing regulator is applied together with a Model 764P pneumatic pressure controller to provide very accurate pressure control; identified by Cashco as a Model 1000HP-1+6 “Accelerator”. Utilize on applications where near instantaneous reactions to flow or pressure variations are desired. Another “special” application is a “Smart Regulator”, which combines use of an I/P transducer and a differential reducing regulator.

### LINE SIZES AVAILABLE

1/2" (DN15), 3/4" (DN20), 1" (DN25), 1-1/4" (DN32), 1-1/2" (DN40), 2" (DN50)

### END CONNECTIONS

NPT, FLANGED, BSP, EXTENDED NIPPLES, 14" FACE TO FACE

### COMMON APPLICATIONS

STEAM, HEAVY OIL

### DESIGN PRESSURE

INLET: UP TO 740 psig (51 Barg)  
OUTLET: UP TO 300 psig (20.7 Barg)

## STANDARD GENERAL SPECIFICATIONS

**Body Sizes:** 1/2", 3/4", 1", 1-1/4", 1-1/2" and 2";  
(DN15, 20, 25, 32, 40 and 50).

**End Connections:** Standard – NPT female.  
Opt-30: 150# or 300# RF flanged.  
Opt-31: BSP female.  
Opt-32: Extended plain end nipples.  
Opt-34: 14" Face to Face Flange  
Dim. (Sizes 1/2"- 1" & 1-1/2" only)

**Body/Spring Chamber Material Combinations:** Uniform – DI/DI and CS/CS.  
Combinations – CS/DI and BRZ/DI.

**DI =** Ductile iron  
**CS =** Cast carbon steel  
**BRZ =** Cast bronze  
See Table 4 for material specifications.  
**NOTE:** BRZ spring chambers are not available.

**Trim Designs:** Metal seated or composition seat (see Figure 1). Metal or composition diaphragms.

"B\_" series designations – BRZ, BR, SST; see Table 6 for materials.  
"S\_" series designations – SST; see Table 7 for materials.  
DI/BRZ, DI/SST.

**Figure 1: Composition Seat Design**

**Body/Cylinder Material Combinations:** BRZ/BRZ.  
CS/SST.

**Maximum Inlet Operating Pressure:** All materials – 400 psig (27.6 Barg)  
(Consult factory for higher pressures).

**NOTES:** 1. 1000HP is a flow-to-open (FTO) design; this places an upper

limitation on inlet pressure for a given differential (range spring) pressure setting.

2. See Table 3 for max. allowable pressure levels.

**Temperature Range:**

Inlet and Outlet, All Materials –

Liquid or Gas

-20° to +400°F

(-29° to +205°C).

Steam

406°F - SAT @ 250 psig

(208°C - SAT @ 17.2 Barg).

**NOTE:** Composition trim or gasket materials may lower above ranges.

**Differential Pressure Range:**

Normal Operating: 10–100 psid  
(0.7–6.9 Bard).

See Table 1 for individual range spring spans.

**NOTE:** 1000HP is a flow-to-open (FTO) design; this places a lower limitation on differential pressure setting for some inlet pressure levels.

$$P_2 = P_{\text{Load}} + \Delta P_{\text{Diff}}$$

$$\text{Max } P_{\text{Load}} = \text{Max } P_2 - \text{Max } \Delta P_{\text{Diff}}$$

**Maximum Loading Pressure:**

All materials –300 psig (20.7 Barg).

**Maximum Outlet Pressure:**

See Table 3.

**NOTES:** Maximum safety relief set-point is not to exceed 1.10 x Maximum Normal Outlet Pressure.

**Minimum Pressure Drop:**

$\Delta P > 5$  psid (0.34 Bard).

**Seat Leakage:**

Meets ANSI/FCI 70-2.

Metal Seated – Class IV.

Composition Seat – Class VI.

**Range Springs:** Standard: Epoxy coated steel.

**Diaphragm Flange Bolting:** Standard: High strength, zinc plated, heat treated steel. For all body/spring chamber materials.

**Gaskets:** Required for metal diaphragm constructions only; not required for composition diaphragm construction.  
Standard: Graphite/NBR.  
Not suitable for Oxygen Service.  $T_{max} = 400^{\circ}\text{F}$  ( $205^{\circ}\text{C}$ ).

**Spring Chamber Vent Valve:** Plated carbon steel.

**Painting:** Standard: All non-corrosion resistant portions to be painted with corrosion resistant epoxy paint per Cashco Spec #S-1606.

## OPTION SPECIFICATIONS

This section indicates special variations which are available to the standard Model 1000HP-DIFF products. Multiple options may be selected; i.e. 1000HP-1+6+15, which is the 1000HP-1+6 product plus Opt-15 together.

**Option -1 (Std.):** CLOSING CAP. A removable ductile iron cap discourages tampering with spring setting. Includes a gasket for sealing the closing cap to the spring chamber, a sealing lock nut and a 1/4" NPT female vent connection.

Seat ring is silver brazed to cylinder for "B\_" series **composition** trim designations, and to 1/2" (DN15) body size cylinders with "S\_" series trim designations. For all other body sizes with "S\_" series designations the seat ring is welded to the cylinder.

**Option -12:** REDUCED PORT ORIFICE. Used when high inlet pressure negates use of the standard full port orifice. Also used when oversized body is desired to accommodate piping size. Available in metal seated or composition seat materials, in all "B\_" or "S\_" series trim designations, and in all body sizes except 1-1/4" (DN32). See Tables 9 and 11 for flow capacity in Cv's.

**NOTE:** Opt-14 is now included whenever Opt-15, stellite seat surfaces is specified.

**Option -14:** INTEGRAL SEAT. Standard pressed-in seat ring-to-cylinder joint is sealed as a path of leakage by brazing or welding. The procedure also serves as a permanent joint for flow conditions where service conditions are "severe", subject to vibration, or thermal cycling.

Figure 2: Opt-14 Integral Seat

**Option -15:**     STELLITED SEAT SURFACES. Available with metal seated S1 trim only, and with full port orifice or Opt-12 reduced port orifice. Both plug face and seat ring's seat edge are coated with stellite hard surfacing using a flame spray process. Always includes integral seat ring Opt-14.

**Option -17:**     PISTON SPRING. Required for applications where pressure drop is less than 5 psid (0.34 Bard). Minimizes plug/cylinder frictional effects. 302 SST material only.

**Figure 3: Opt-26 Drain Hole**

**Option -26:**     DRAIN HOLE. 1/4" NPT drain tap with plug in body underside. Recommend use with highly viscous fluids (above 100 centipoise (Cp)) for downstream piping pressure sensing. Plug material similar to body material. Recommended for flashing liquids.

**Option -27:**     VISCOUS LIQUID SERVICE. Incorporates special valve plug with drilled openings near the "jet effect" zone to stabilize operation for fluids with viscosity greater than 100 Cp. Brass or SST metal seated trim ONLY.

**Option -30:**     FLANGED END CONNECTIONS. CS body material only. Flange and pipe nipple materials of same general chemistry as body material. Available as 150# RF or 300# RF flange configurations per ASME B16.5 Group 1.1. Requires lapped joint-type flange on inlet (cylinder) end. Pipe nipples socket welded to body and cylinder. Outlet connection flange is socket weld-type. See Table 14 for lowered P vs T ratings. No post-weld stress relieving performed. Not available for 1-1/4" body size.

**Option -31:**     BSP SCREWED END CONNECTIONS. British Standard Pipe threads per ISO 7/1; used as alternate to NPT ends. Available all sizes and body materials.

**Option -32:**     EXTENDED P.E. NIPPLES. Schedule 80 plain end pipe nipples used for field butt or socket welding into pipeline. Pipe nipples of same general chemistry as body material. Short-threaded pipe nipples seal welded to body and cylinder. Adds approximately 8 inches (200 mm) to the face-to-face dimension of standard unit.

**Option -34:**     SPECIAL 14" FACE TO FACE DIMENSION FOR FLANGED END CONNECTIONS. Sizes 1/2" - 1" & 1-1/2" only. See Opt.-30 for standard face to face dimension.

**Option -65:**     FLOW-THRU SPRING CHAMBER. Spring chamber provided with two female NPT connections on spring chamber, allowing loading pressurizing fluid to be recirculated. Recommended for heavy oils with high paraffin content. CS spring chamber only. Tapped connection sizes dependent on body size:

Body Size		Tapped Connection Sizes - inch
inch	(DN)	
1/2"	(15)	1/2" NPT
3/4"	(20)	1/2" NPT
1"	(25)	3/4" NPT
1-1/4"	(32)	1" NPT
1-1/2"	(40)	1" NPT
2"	(50)	1-1/4" NPT

Utilized in harsh atmospheric conditions.

\* A pressure loaded regulator is defined herein as a differential regulator that uses a minimum of spring force and a maximum of loading pressure to generate the P2 outlet pressure. By minimizing spring force, the droop is kept to a minimum. See page 5. TABLE 13 values are based on a 25% droop value for calculation purposes.

<sup>1</sup> Outlet pressure is the same spring setting for differential pressure and loading pressure. Indicated outlet pressure limits are those to contain overpressure conditions; such overpressure may cause diaphragm damage. It is recommended that pressure safety devices – safety relief valve or rupture disc – have their setpoint relief pressures at 110% of the UVRS (UVRS = “Upper Value of Range Spring”), plus the maximum loading pressure. Example: For a 10–40 psid (0.7–2.8 Barg) range spring and a P<sub>Load Max</sub> = 100 psig (6.9 Barg), the safety device should be set to relieve at 110% x (40 + 100) psig = 154 psig (10.6 Barg).

BC = Neoprene. NBR = Buna-N. FKM = Fluorocarbon Elastomer. TFE = Polytetrafluoroethylene.
